EDUCATION

Bachelor of Science (Honours) - Computer Science

(Expected 2027)

Toronto Metropolitan University (formerly Ryerson University)

Relevant Coursework: Algorithms, Database Systems, Operating Systems, UNIX/C/C++

SKILLS

Languages: Python, Java, JavaScript, SQL, C, C++

Frameworks/Libraries: Discord.py, Flask, Selenium, OpenCV, pytest, Pydantic

Data & Integrations: SQLite, Google Sheets API, StockX API, OpenAI API, REST APIs, OAuth 2.0

Tools: Git, Linux/Unix, Codex, Claude Code

EXPERIENCE

Owner & Software Developer — Independent E-commerce Operations Platform (Jul 2023 – Present)

- Founded and scaled a multi-marketplace resale business to approximately **\$153K CAD in revenue**, \$57K gross profit, and **1,064 completed sales**, maintaining an approximately 37% gross margin.
- Built and operate an internal Python platform integrating Discord, SQLite, StockX, and Google Sheets to automate market research, inventory tracking, and sale reconciliation across daily operations.
- Used margin, sell-through, and seasonal-demand data to guide purchasing and inventory allocation, contributing to **31% year-over-year revenue growth** from approximately \$59K in 2024 to \$77K in 2025.

Co-Founder & Operations Lead — Amazon FBA Business

(Jan 2024 – Apr 2026)

- Led operations for a three-person Amazon FBA business generating \$104K+ CAD in revenue, managing product launches, supplier relationships, inventory planning, and marketing strategy.

PROJECTS

Resale Operations & Inventory Platform

Python, SQLite, Discord.py, OpenCV, zxing-cpp, OpenAI API, StockX API, Google Sheets API, pytest

- Built a Discord-based market-intelligence workflow that resolves exact StockX size variants, reducing price research from **45–60 seconds to approximately 5 seconds per item**.
- Engineered a transactional SQLite identity layer with immutable IDs, schema migrations, message-level idempotency, and retry-safe Google Sheets synchronization; backfilled **1,129 rows without duplicate unit identities**.
- Built a hybrid shoe-label intake pipeline using OpenCV, zxing-cpp, UPC/EAN validation, and OpenAI Structured Outputs to resolve exact StockX variants and block ambiguous scans.
- Automated StockX sale reconciliation by normalized style and size, synchronizing payouts, profit, and inventory state; validated failure recovery with **100+ tests** using temporary databases and mocked APIs.

Product Discovery & Profitability Engine

Python, Selenium, REST APIs, Regex, JSON, Concurrent Processing, Dynamic Programming

- Built an authenticated catalogue-monitoring pipeline that snapshots and diffs a dynamic product catalogue, reducing a recurring **15-minute review to 2–3 minutes—80% faster** and approximately **50 hours saved annually**.
- Engineered resilient extraction for lazy-loaded and paginated pages using load stabilization, fallback parsing, and partial-result recovery; extracted style codes absent from page data through image URL parsing and validated them against product identifiers.
- Built a size-aware purchasing engine using throttled concurrent StockX requests to estimate net profit after taxes and fees, rank opportunities by ROI, and apply **0/1 knapsack optimization** for budget-constrained purchasing.
